musical instruments 35.000 years ago ...

... until the 19th century

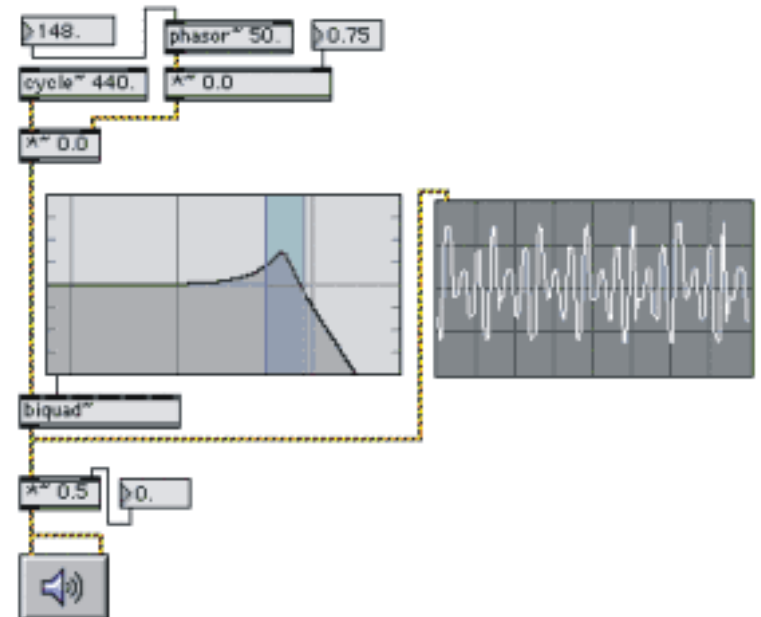

pioneers of electronic music

from analog sound synthesis

to digital sound synthesis

an office tool as musical instrument?

but how can we control all these parameters?

the need for extended musical interfaces

various types of musical controllers

decoupling control & sound generation

musical remote control

a musical instrument ...

... unifies control and feedback

Graphical User Interfaces

separate control from representation

Tangible User Interfaces

**... unify control & representation
within tangible physical artifacts**

Embodiment

**physical objects are containers for digital
information and processes**

Tangible Surface Instruments

Spatial Systems

Object Oriented Sequencers

Relational Systems

Token based Sequencers

Token-Constraint Systems

Building Block Sequencers

Constructive Assemblies

Tangible Musical Artefacts

Physical Containers

++ reactable - tangible modular synthesizer

++ fundamental inspirations

++ Björk tour, BBC 2007

++ first experiments, Medialab Europe 2003

++ first public prototype, NIME 2004

++ first public concert, ARS Linz 2005

++ Reactable Experience

++ Reactable Live!

++ Reactable Mobile

++ shape: generic object classes

+ sound generators: squares, cubes

oscillators, sound fonts, samples, phys. models

+ sound effects: rounded squares

filter and effects (band pass, delay, distortion ...)

+ control generators: round disks

LFOs, melody generator, random

+ step sequencer: round polygons

+ global objects: star shape

tempo, tonality, volume

++ dynamic patching paradigm

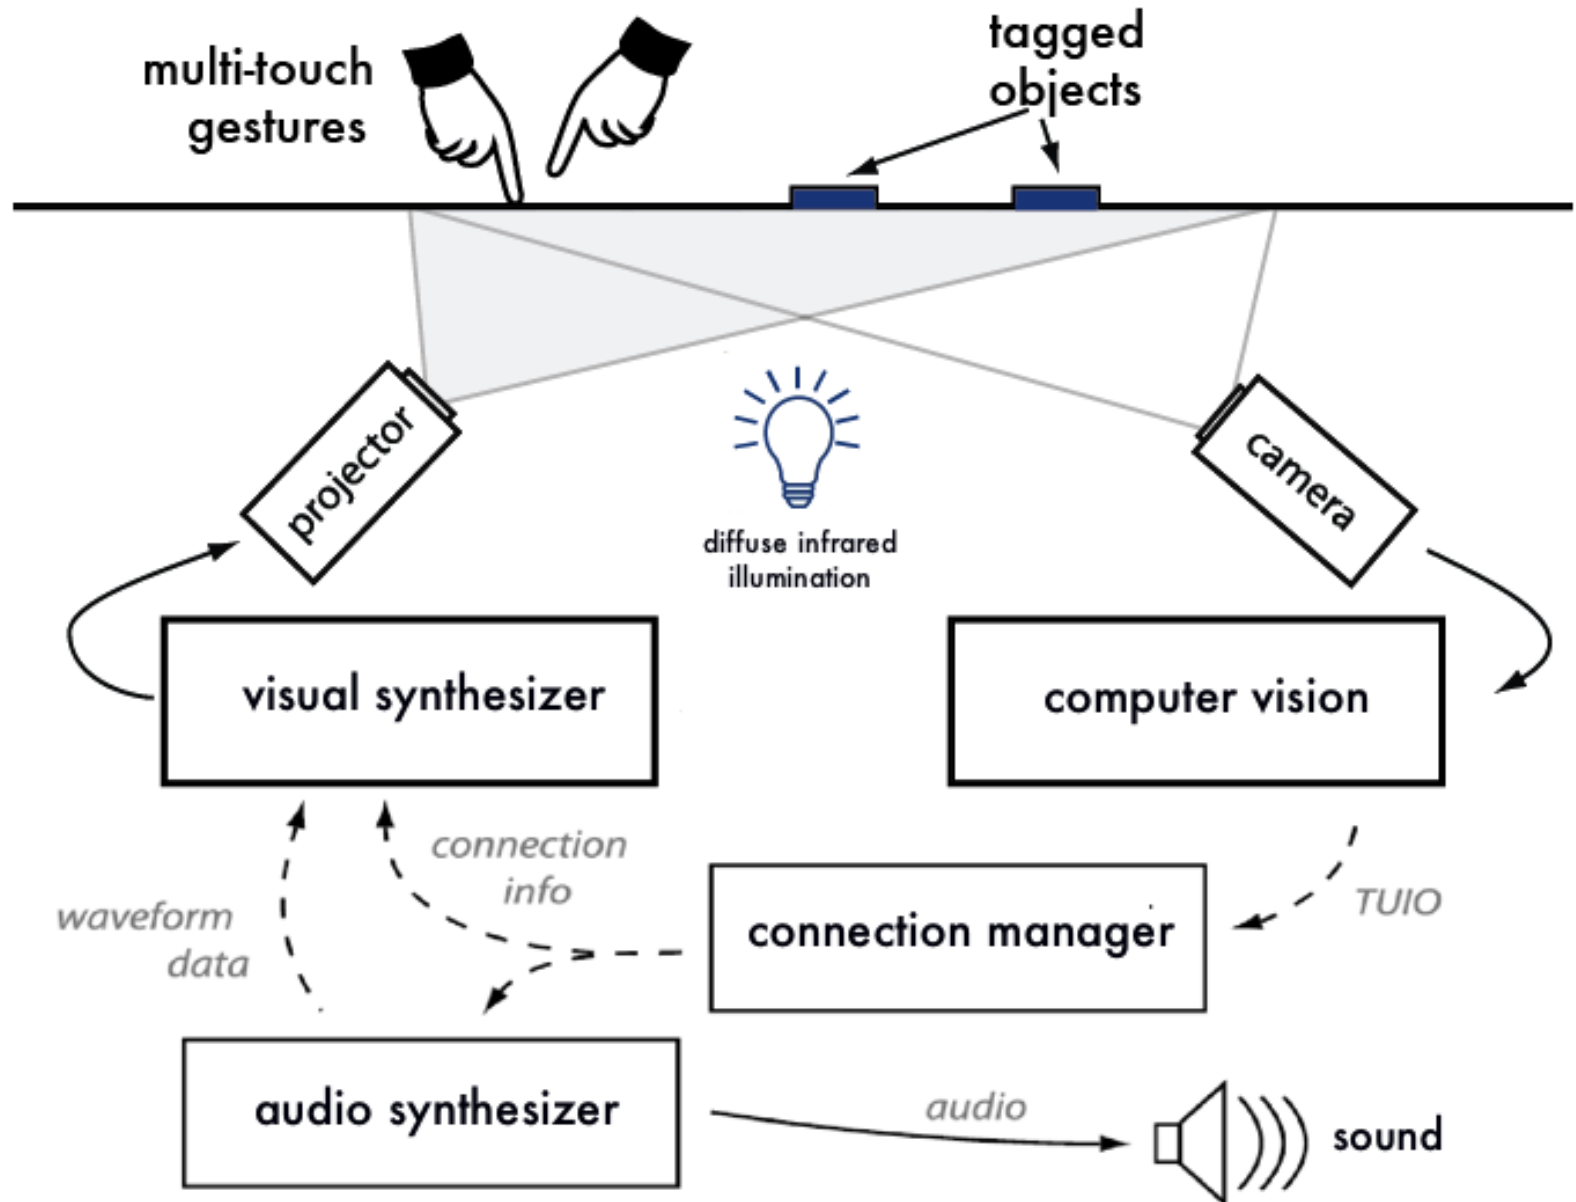

++ visual feedback

++ collaborative instrument

++ system diagram

++ reactTVision

++ community projects

This channel is a showcase for tangible interface projects made with the reactTIVision toolkit.

reactivision.sourceforge.net/

Another list of tangible musical interfaces made with reactTIVision:

modin.yuri.at/tangibles/?list=7

Thanx for adding the vid to your channel...
And thx for your great reactTIVision framework of course!!!

++ student project – Interface Cultures

++ object abstraction

++ amoeba symbols

++ fiducial breeding – genetic algorithm

++ region adjacency graph

Some simple topologies and their corresponding region adjacency graphs.

- (a) a reactIVision fiducial (b) black and white leafs and their average centroid
(c) black leafs and their average centroid, and
(d) the vector used to compute the orientation of the fiducial.

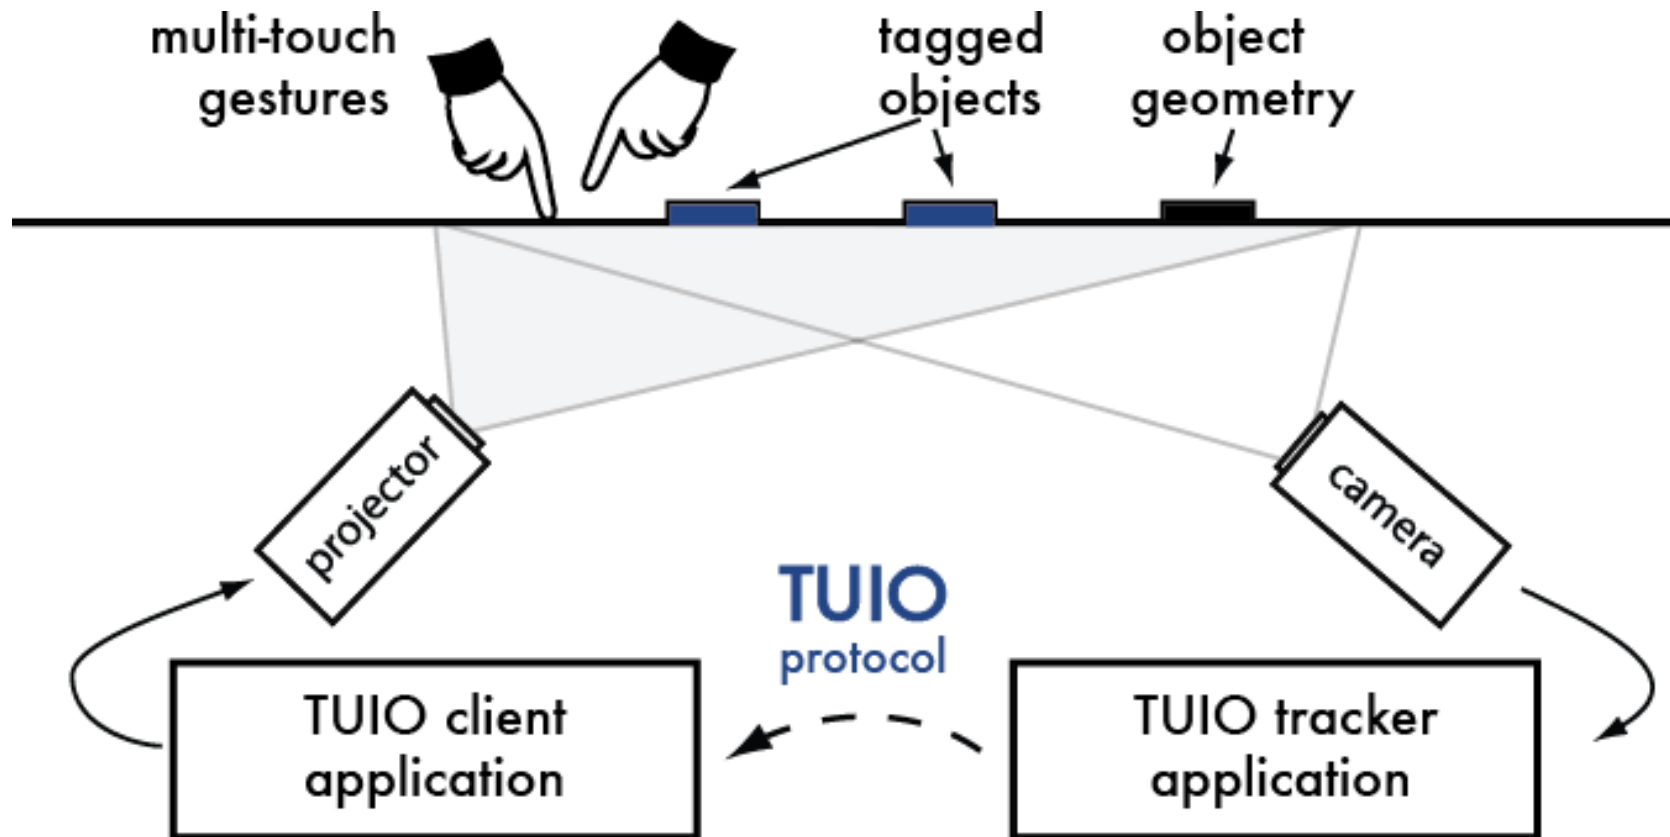

++ marker, finger & object tracking

++ token, pointer & geometry abstraction

++ TUIO framework architecture

++ TUIO components

+ original TUIO 1.0

Objects: **/tuio/2Dobj**

describes arbitrary physical objects, which are usually tracked with the help of visual symbols (fiducial markers), RFID tags or similar methods
tokens are not defined by their physical appearance but by their ID
encodes position and rotation angle.

Cursors: **/tuio/2Dcur**

describes surface pointers such as finger touches or dedicated devices
multiple pointers are only distinguished by their position

+ extended TUIO 1.1

Blobs: **/tuio/2Dblob**

describes the bounds of untagged physical objects
encodes position, and oriented bounding box (angle, width, height)
can be used to additionally describe the approximate object geometry

++ TUIO 2.0 - tangible abstraction framework

+ revised component definition

Tokens (objects), **Pointers** (cursors), **Geometries** (blobs)

+ additional components

Symbols: allow the encoding of extended symbol content

Controls: for the association of additional control dimensions

Associations: allows description of physical connections & relations

Geometries: Contour, Skeleton, Area ... (incremental detail)

+ extended attributes

e.g. pointers include dedicated pointer/user ID, pressure attribute, ...
tokens allow the use of different symbol types

+ timing infrastructure

for improved gesture recognition capabilities
